

SECURITY FOR ALL SIZES

 **cemit**
protection system

Security for large-scale retailers.

MADE IN ITALY

Innovation and dialogue: the secrets of security.

In almost 40 years of continuous dialogue with our prestigious partners, we have managed to introduce many important technological innovations in the field of security, so much so that we have become a benchmark for the protection and handling of valuables for the goldsmith industries, jewellery, large industrial groups and large retailers.

NIGHT SAFE

SECURITY AND EFFICIENCY FOR LARGE-SCALE DISTRIBUTION

This allows the management and monitoring of payment operations where employees enable the opening of the checkout compartments with their electronic keys and insert cases identifiable by embedded tags at the end of their shifts. The system can thus detect the transfer and record the deposit carried out together with the name of the person making it and the time. At the moment of withdrawal by the appointed person, the system generates a report with a summary of the payment and the withdrawal operation and delivers it by email to the designated recipients. The cases can be customised.

QUICKBLOCK

INTERNAL ANTI-THEFT SYSTEM

- CONTROL AND MANAGEMENT THROUGH THE **ICARUS** SYSTEM
- ACTIVATION WITH ELECTRONIC KEYS
- KEY SECURITY GUARANTEED BY BILLIONS OF COMBINATIONS
- AN ENCRYPTED ACCESS KEY FOR EACH AUTHORISED PERSON
- CONTROLLED OPENING OF ONE SHOWCASE AT A TIME
- ABILITY TO CONSULT THE HISTORY (EVENT MEMORY)
- DESIGN AND CUSTOMISABLE FEATURES

QuickBlock is a product designed specifically to lock shop windows, drawers and lockers for shops and offices, especially used in jewellers and boutiques within malls. QuickBlock is particularly suitable for structures made of wood or glass containing documents or valuables (e.g. jewellery displays, mobile phones, DVD players, cameras, video cameras, etc.) that have very little or no inherent anti-theft protection. Inside a shop, a pharmacy, the jewellers at the mall, or in a private office or cabinet, in the presence of staff, the risk is not so much of a violent robbery, but rather the bag-snatcher who takes advantage of a distraction, good faith or confusion in order to skilfully put a burglary into action and consequently steal, damage or copy products or documents while unnoticed.

That's why QuickBlock was born! This exclusive patented lock system - the ingenious idea of uniquely incorporating the mechanical locking group, the emergency release key and the electronic key reading system - coupled with the simplicity of a lock mechanism, make QuickBlock an innovative and unique system of its kind. The drawer or showcase, which use a simple mechanical key, if left inadvertently or forcefully opened, will not give any alarm signal. QuickBlock, however, will report an anomaly to the operator. Available in various configurations, it is suitable for any type of wooden or glass door. The QuickLine version is specially designed for the management and control of sliding glass windows. QuickBlock and QuickLine are compatible with all other Cemit products and can be linked to the Icarus System for network management.

VALUABLES DRAW

**MAXIMUM PROTECTION
WITH A SMALL GESTURE**

Armoured drawers that are used at reception and customer service points are protected by QuickBlock. Specifically, it is set to activate a timer at the time of opening with electronic key that warns the operator if it is not closed. It is also sensitive to burglary attempts, automatically triggering an alarm which can be deactivated only by an enabled key. Enabled personnel have their own electronic key with customised for access times within which to carry out tasks. After this period, if the drawer is not closed, a local and remote audible warning signal begins.

MONITORING ACCESS POINTS

To combine a complex apparatus of money transfer in an easy but secure way, it's necessary to rely on a highly dependable system. Cemit's equipment also manages the door of the pick-up point and its safes, in addition to the employee entrance gate. All devices are managed by the Icarus System platform, specifically developed to meet the needs of the large-scale retail organisation.

Cemit is available for consultation and development of tailor-made security plan an area.

SIA TIRELESS RESISTANCE

The SIA lock is unique in its kind, with an exclusive Cemit patent. A product adopted by the most prestigious goldsmith industries and the largest institutions for the custody and handling of valuables, for

its features of quality and reliability. Thanks to its hydraulic operation, it can withstand continuous working cycles with no overheating issues.

ROBO SECURE AND VERSATILE

ROBO is a mortise lock designed specifically for armoured sections of aluminium and steel. Its particular release mechanism guarantees, unlike piston or bayonet locks, the release of the lock

even in the case of severe pressures exerted on the door itself. Also applicable on doors used for emergency exits.

APOLLO - patrol service

TOTAL PROTECTION WITHIN EASY REACH

The Apollo control system has the ambition of being able to digitally manage the surveillance service. It is particularly suitable for large organisations where security is not limited to just patrolling the entrance, but where full monitoring of several areas of the facility is expected. In this case, a transponder is provided to the agent on a personalised basis.

The key will be programmed to open the access gate during the patrol period, the operator, instead of using the traditional card check, passes the key over the reader at the arranged access point and the system records and timestamps the event.

The development of digital management not only guarantees more protection due to the presence of security keys that operate only at certain times of the day, but also allows, in the case of contracts involving multiple passes, to establish exact respect of the predicted timetable.

Apollo is not exclusively limited to this, but is particularly useful when managing large complex areas becomes impossible using traditional methods; the advantage of this approach is its synergy between all systems which, managed remotely, are optimised and become incredibly effective and high-performing.

MONITORING DOORS AND ACCESS POINTS

TRANSPORT OF VALUABLES - LARGE RETAILERS - SHOPS - JEWELLERY - COMPANIES - SECURITY SERVICE PROVIDERS

This is the area that effectively manages the protection of access points. Unauthorised access can be inhibited by a smart approach, monitoring and targeting operators and promptly reporting any anomalies; or even physically with high-tech seal-tight locks. These two complementary systems maximise the results to be achieved.

SHOWCASE AND DRAWER MONITORING

SHOPS - JEWELLERY - LARGE RETAILERS - COMPANIES

We can simplify it with an innovative anti-theft system. The opening of showcases and drawers in the shop is thus regulated by electronic keys and security locks monitor access, usage times and the individual interacting with them. This allows for the prevention of unauthorised acquisition of information and theft without the administrator's knowledge.

CASH REGISTER MONITORING

LARGE RETAILERS

This includes a number of services dedicated to large retail organisations such as cash flow within a facility, security of individual locations, and withdrawal by cash/valuables-in-transit bodies. All of these phases are completely managed by the platform, through which it is possible to trace actions back to the person responsible and to the time and place an event occurred. A streamlined implementation of sensitive tasks that does not sacrifice robustness thanks to its incredibly resilient and burglar-proof installations.

PATROL SERVICE

COMPANIES

With Apollo we focus on Cemit's service which compares with the great industrial organisations and aims to create a system for the simplified coordination of resources. This also includes liaison with both internal and external surveillance organisations such as supervisory agencies or law enforcement agencies.

EACH PRODUCT IS AVAILABLE FOR INDIVIDUAL PURCHASE AS NEEDED

GLOBAL MONITORING

ICARUS SYSTEM

THE ICARUS SYSTEM is the most advanced access control system in Cemit's range of products, thanks to our experience gained in the security industry over the years. Its extreme adaptability allows to meet the diverse needs of jewellers, stores, shopping malls, companies, security service organisations, counting rooms and cash/valuables-in-transit.

The platform, highly expandable and adaptable to any type of user, consists essentially of the control unit, which oversees all functions of the system, and the PC side control software that communicates with the control unit via TCP/IP allowing total remote management over LAN/WAN/VPN. The system works without the use of a PC, which is only necessary for programming through our software.
